

Trial Task: Trading Journal MVP (3-Hour Timebox)

Objective

Build a minimal working prototype of a trading journal application that demonstrates your ability to structure data, integrate external tools, and deliver a clean full-stack solution under time constraints.

Time Constraint

- You have a **maximum of 3 hours** to complete this task
 - The goal is to demonstrate how much you can get done within the given time
 - If you do not complete all features, **submit what you have**
-

Important Note on Evaluation

- Your **code will be reviewed by a trusted peer developer**
 - We will evaluate:
 - Code quality and structure
 - Decision-making and prioritization
 - Use of best practices
 - How effectively you leverage tools (including AI)
-

Scope

Focus on functionality and design.

Requirements

1. Authentication (Simple)

- Create a basic login screen
 - Hardcoded credentials are sufficient (no user management required)
 - After login → redirect to dashboard
-

2. Trade Import (CSV)

- Provide a CSV upload interface
 - Parse and import trades into the system
 - Map key fields (e.g. date, symbol, entry, exit, PnL, etc.)
 - Store data (local state or simple backend like Supabase is fine)
-

3. Trade List & Classification

- Display all imported trades in a list/table
 - Allow assigning a **strategy** to each trade:
 - Strategy 1
 - Strategy 2
 - Strategy 3
-

4. Trade Detail View

- Clicking a trade opens a detail view

- Show entry and exit visually
 - Ideally embed a chart (e.g. TradingView widget or similar)
-

5. Basic Analytics

- Provide a simple performance view:
 - Monthly overview OR
 - Calendar-style view
 - Clearly indicate:
 - Profitable days
 - Losing days
-

6. AI Chat (Data Interaction)

- Add a chat interface
 - Connect to an LLM via API (e.g. OpenRouter – API key will be provided)
 - Develop [analysis.md](#) as a skill to use to communicate via chat.
 - User should be able to ask basic questions about their trades.
-

6. AI Chat (Data Interaction)

- If you have any creative ideas, feel free to throw them in.
-

Evaluation Criteria

- Code structure and clarity

- Speed of execution
 - Practical decision-making under time constraints
 - Ability to integrate external tools (CSV parsing, charting, LLM)
 - Overall usability of the prototype
-

Notes

- UI/UX should be clean
- You are encouraged to use AI tools (e.g. Cursor, Claude)
- Prioritize delivering a working end-to-end flow
